

Pre-meeting (5 minutes before)

- **Open dashboard:** Double-click `DataNexus_Dashboard_Wired.html`
- **Start the API:** `cd api-service && uvicorn app.main:app`
- **Verify green dot:** Top-left header shows "Fabric · operational"
- **Sign in:** Settings ■ → admin / admin123
- **Practice:** Run all 4 compliance checks once. Run Telugu query once.
- **Backup:** If wifi fails, dashboard auto-falls back to demo data.

Opening (10 seconds)

SAY: "Before I start: this is not a slideshow. Everything you're about to see is running live. The numbers are real. The blockchain transactions are real. If something breaks, you'll see it break — that's how I know it's working."

WHY THIS WORKS: Indian CTOs have seen too many polished demos with stock data. Saying "this is live" upfront resets their skepticism and earns 60 more seconds of attention.

The 60-second flow

1

0–5s

Click Overview tab

"This is the live fabric. 6 nodes across 4 regions, all online. The pulsing green dot means we are connected to Hyperledger Fabric right now."

2

5–20s

Click Compliance tab → Run all 4 checks

"Watch this. Four border transfers, four jurisdictions — DPDP, GDPR. The system decides automatically. Apollo to Mumbai is allowed. Apollo to US pharma is blocked. Each decision has

3

20–25s

PAUSE — let the silence work

"(say nothing — point at the BLOCKED row — let the CTO read the DPDP-001 reason themselves)"

4

25–40s

Click Query tab → click Telugu sample → Run

"A business owner in Hyderabad types this in Telugu. We translate to Presto SQL. Real results in milliseconds. No SQL training. No English required."

5

40–45s

PAUSE — point at the Telugu text

"(say nothing — let them realise this is a civilisational unlock for 500 million people)"

6

45–55s

Click Audit tab → scroll the chain

"Every transformation, every access, every compliance decision — permanent. Court-admissible. Generate a 60-second blockchain-verified compliance report on demand."

7

55–60s

Close — ask the question

"Two questions. One: which of your data pipelines should we run this against in a 90-day pilot? Two: what would I need to do today to make that easy for you?"

Objection handling (memorize 5 — they come up 80% of the time)

OBJECTION "We are happy with AWS."	RESPONSE Great — most companies on AWS still struggle with DPDP because AWS is structurally US-routed. I am not asking you to leave AWS. DataNexus runs on AWS too — at 60% lower cost. My question is about your DPDP audit setup, not your cloud choice.
OBJECTION "Our internal team is building this."	RESPONSE Smart — internal teams are great for ownership. Out of curiosity — how many engineers on it, how long has the project been running, what is the production timeline? Most companies budget 18 months and use 25.
OBJECTION "Send me a deck and I will review."	RESPONSE I will. But decks get filed and forgotten. Could I instead show you a 5-minute live demo of the blockchain compliance feature? That is the one thing where DataNexus is genuinely different. After that, you decide if a deck makes sense.
OBJECTION "DPDP is not urgent for us yet."	RESPONSE I am hearing that from half the people I talk to. The other half are scrambling because their first audit is in 60-90 days. RBI is pushing banks especially hard. Do you know when your first audit is scheduled?
OBJECTION "What is your pricing?"	RESPONSE I am not at the pricing stage yet. The platform is open source — you can run it for free. We charge for managed deployment, support, and pilots-to-paid contracts. For your size, typically ■10-25L per year. But I would rather understand your problem first.

After the call — within 24 hours

- Send a 3-sentence thank-you email.** Reference one specific thing they said. Promise the next deliverable with a date.
- Update the outreach tracker.** Score the customer: Urgency, Budget, Authority, Need fit, Speed (1-5 each).
- Ask for ONE referral.** Even from a "no". 30% will refer someone in their network.
- If interest: send pilot proposal.** 90 days, free, scope = the ONE pain they mentioned, success metric agreed in writing.
- Calendar block — follow-up in 7 days.** Physical next step: a working session, a deck, or a stakeholder intro.

If the demo breaks

Wifi dies: the dashboard auto-detects and falls back to demo data. Say: *"Connection dropped — but the dashboard still shows what just ran. In production this auto-reconnects."* Then continue.

API crashes: dashboard shows orange "Demo" banner. Same script — the data is identical, just static. Do not apologize. Continue.

Wrong tab clicked: use the keyboard. Tab key cycles through interactive elements.

Their question stumps you: say "I don't know — let me follow up by email tomorrow with the answer." Honesty closes pilots. Bullshit kills them.

"Yogah karmasu kaushalam" — excellence in action is yoga.
